

COGNITIVE BEHAVIORAL THERAPY (CBT) – SESSION 6

New Case: Aryan – Worry Postponement & Review *Full Detailed – More Realistic Style*

SESSION INFORMATION

Client:	Aryan (32 y/o Male)	Therapist:	Dr. A.
Session #:	6 of 18–20	Focus:	Worry Postponement + Review

PRE-SESSION THERAPIST NOTES

Client attempted behavioral activation with partial success — he did 2 out of 3 planned small activities. Worry Time helped on some days. He expressed ongoing frustration that progress feels slow. Today's plan: Review homework, introduce **Worry Postponement** (building on Worry Time), continue cognitive restructuring, and assign integrated homework.

SESSION START & HOMEWORK REVIEW

Therapist: Good morning, Aryan. How has your week been? Let's review the homework.

Client: It was mixed. I managed to do two small activities (short walk and reading for 15 mins). It felt a bit better on those days. Worry Time helped sometimes, but on other days the worries were too strong. I still feel like things are moving very slowly.

Therapist: Thank you for being honest. Doing even two small activities is progress, especially when motivation is low. These small steps often add up over time. The fact that you noticed some improvement on those days is useful.

INTRODUCING WORRY POSTPONEMENT

Therapist: Last session we introduced Worry Time. Today I'd like to build on that with **Worry Postponement**. It's similar but more flexible. When a worry comes up during the day, instead of engaging with it immediately, you briefly write it down and tell yourself: "I'll deal with this later during my Worry Time." This helps train your brain to delay worry rather than suppress it or get caught in it all day.

Client: I've kind of been doing something similar already on some days. But I'm not sure how much it's helping overall.

Therapist: That's completely normal. These techniques usually become more effective with consistent practice over several weeks. The goal is to reduce how much worry interferes with your day and energy. We can keep practicing and see how it develops.

CONTINUING COGNITIVE RESTRUCTURING

Therapist: Last session your belief in "I have to be perfect or they will start doubting me" was around 55–60%. How much do you believe it now?

Client: Still around 55%. It hasn't changed much this week.

Therapist: That's okay. These core beliefs often shift slowly. The combination of behavioral experiments, daily evidence collection, and real-life experiences usually helps the balanced thought become stronger over time. We'll keep working on it gradually.

HOMEWORK ASSIGNMENT

Therapist: For this week:

1. Continue daily diary + Worry Time / Worry Postponement practice
2. Continue scheduling 2–3 small activities per week (behavioral activation)
3. Continue the time-limit experiment with small tasks
4. Rate belief in the old thought daily and use the balanced thought

SESSION SUMMARY & FEEDBACK

Therapist: Today we reviewed your mixed but honest progress, introduced Worry Postponement, and continued cognitive work. How are you feeling about today's session?

Client: I'm still not seeing big changes, but I'll keep trying the small activities and Worry Postponement.

Therapist: That's fair. These skills usually become more natural and effective with time and practice. Any questions?

Client: No.

POST-SESSION THERAPIST NOTES

- Client had partial success with behavioral activation and Worry Time — realistic.
- Introduced Worry Postponement; client had already been doing something similar informally.
- Belief in old thought remains stable (~55%) — normal at this stage.
- Client continues to express frustration about slow progress — realistic.
- Next session: Review homework, continue cognitive work, introduce imagery rescripting for core belief if appropriate, or deepen behavioral activation.
